

Seven DNA-repair pathway member-gene counts per source sample

26 mouse tissues in a 4 × 7 layout; each tissue is framed, and the lower-right two cells contain the symbol legend.
Each point is one source sample column; symbol = pathway, colour = sample status; median labels are shown.
Presence = finite source value – 1 > 0; Ensembl Gene IDs are counted once per pathway.
Teacher-text/Table S3 catalog sizes: BER 54 | NER 53 | MMR 27 | FA 39 | HR 135 | A-EJ 9 | NHEJ 18.

Counts describe repertoire presence, not pathway activity or expression magnitude. Source column labels, including technical-replicate markers, are retained in the audit table; no imputation was performed.
